

# Using evolution to improve crop productivity: The case of the C4 pathway

Ivan Reyna-Llorens

Email: [iar28@cam.ac.uk](mailto:iar28@cam.ac.uk)

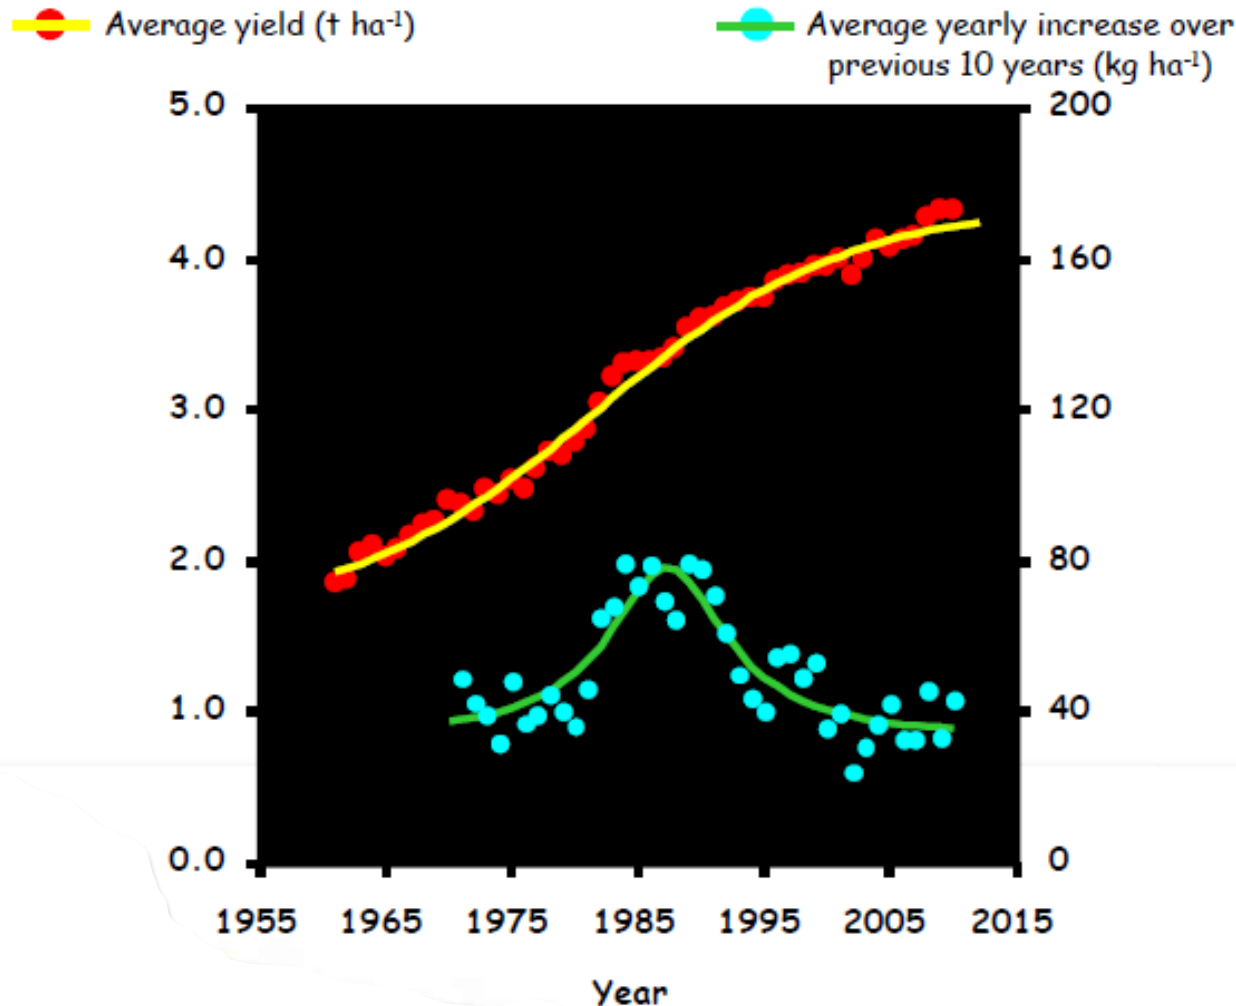

**UNIVERSITY OF  
CAMBRIDGE**

# World Rice Yield (1961-2010)

Data Source: FAO

We need to increase crop production

# Photosynthesis

## *Ingredients*

Sunlight +

water      carbon  
              dioxide

## *Product*

carbohydrates      oxygen

# Respiration

## *Product*

water      carbon  
              dioxide

## *Ingredients*

carbohydrates      oxygen

# C<sub>4</sub> enhances photosynthesis using a two compartment CO<sub>2</sub> Concentrating Mechanism

# The world's most productive crops use C<sub>4</sub> photosynthesis

Maize

Sugarcane

Sorghum

Millet

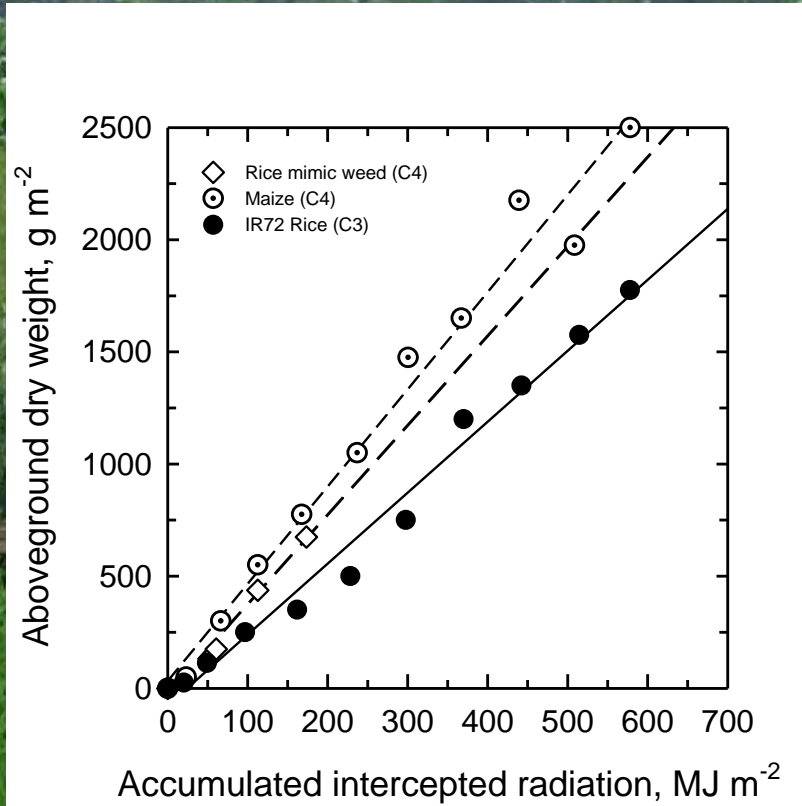

Miscanthus x giganteus

Switchgrass

# Adaptations allow $C_4$ plants to outperform $C_3$ crops in biomass production for food

Maize ( $C_4$ ): 13 Tons/ha

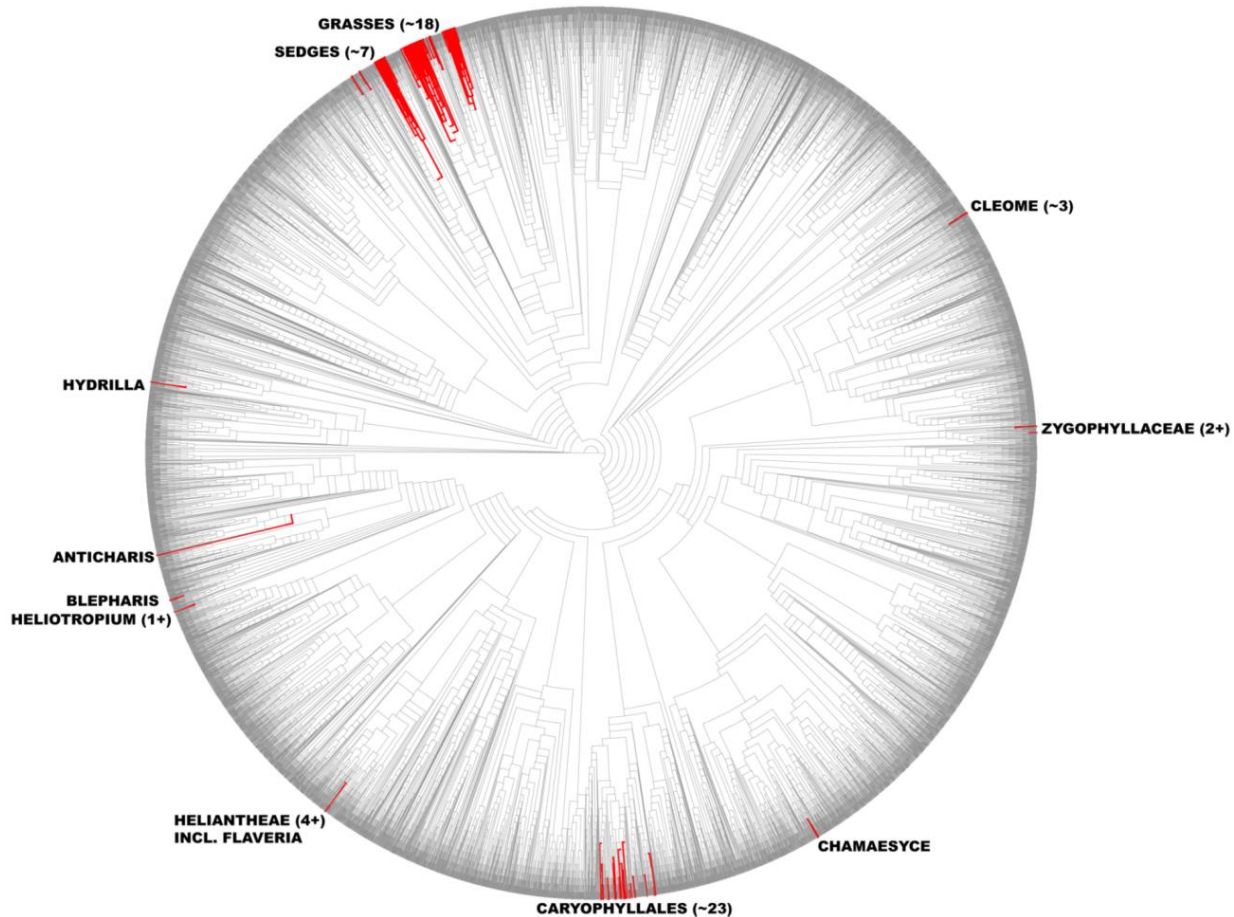

Rice ( $C_3$ ): 8.3 Tons/ha

# Lessons from Evolution

**C<sub>4</sub> photosynthesis is one of the largest examples of convergent evolution**

**Despite its complexity, C<sub>4</sub> has evolved independently ~70 times**

**The acquisition of C<sub>4</sub> already happens in nature**

# Evolutionary Change

Genetic alterations

$$\mathbf{C3} + \begin{array}{|c|} \hline \text{Anatomy} \\ \hline \text{Change} \\ \hline \end{array} + \begin{array}{|c|} \hline \text{Biochem} \\ \hline \text{Change} \\ \hline \end{array} + \begin{array}{|c|} \hline \text{Fine} \\ \hline \text{Tuning} \\ \hline \end{array} = \mathbf{C4}$$

**Localize and characterize both pre existing and novel features relevant to the C<sub>4</sub> pathway**

**Novel Proteins**

**Pre-existing genes**

# In summary

---

- Understanding the evolution of complex traits is vital for crop improvement
- In the near future, we will be able to design a  $C_4$  gene cluster and precisely install into rice or other species
